

Sow early spring in moist seed compost and barely cover the seed. Germination usually takes 8-14 days at 24-27C (75-80F). Transplant seedlings when large enough to handle into 7.5cm (3in) pots and finally into 25cm (10in) pots or grow bags. Aim for a night temperature of between 16-24C (60-75F) otherwise fruit setting may be poor. Likewise keep daytime temperature around 24C (75F) for best results.

For pictures and write-ups of specific varieties and printable growing instructions please see our website.
